**OBSERVATORIO GEOMAGNÉTICO DE
SAN PABLO – TOLEDO**

SPT

OBSERVATORIO GEOFÍSICO DE SAN PABLO – TOLEDO (SPT)

1. INTRODUCCIÓN

Este anuario recoge los resultados de las observaciones magnéticas llevadas a cabo durante 2004 en el Observatorio de San Pablo – Toledo, situado a 50 Km. Al suroeste de la ciudad de Toledo. Este Observatorio reemplazó en 1982 al de Toledo (1934-1981).

Todos los valores de este anuario están referidos al pilar de observaciones, cuyas coordenadas son las siguientes:

| PILAR FUNDAMENTAL | | | | | SPT |
|-------------------------|---------------|--------|---------------------------|----------|-----|
| COORDENADAS GEOGRAFICAS | | | COORDENADAS GEOMAGNÉTICAS | | |
| LATITUD | LONGITUD | ALTURA | LATITUD | LONGITUD | |
| 39° 32' 50'' N | 4° 20' 55'' W | 922 m | 43° N | 76° E | |

Las coordenadas geomagnéticas están referidas al Polo Magnético IGRF 1995 (79.3° N; 71.4° W)

2º. MEDIDAS ABSOLUTAS Y BASES

Las observaciones absolutas de Declinación e Inclinación se han realizado una vez por semana, en series de tres medidas, con un equipo DI-flux constituido por un teodolito amagnético Zeiss Theo 010B y un fluxgate con sensor y electrónica digital Bartington.

La siguiente tabla muestra la desviación estándar de las diferencias de las dos observaciones utilizadas para calcular la base adoptada, como promedio de ambas, de un número total de 102.

| Año | H (nT) | D (') | Z (nT) |
|------|--------|-------|--------|
| 2004 | 0.25 | 0.07 | 0.19 |

La fuerza total F referida al pilar fundamental es obtenida por un magnetómetro de efecto Overhauser GSM90 instalado en el pabellón de absolutas. Un segundo magnetómetro Overhauser GSM90 situado en el pabellón de variómetros, permite controlar las diferencias entre ambos pabellones.

Las bases diarias se obtienen por interpolación lineal entre las bases semanales adoptadas. El gráfico siguiente muestra las diferencias medias diarias entre la componente total F calculada de las bases definitivas, y el valor de F registrado por el magnetómetro Overhauser GSM90 referido al pilar fundamental.

3º. VARIÓMETROS

Las variaciones del campo magnético terrestre han sido registradas en forma digital con valores cada minuto, por los tres equipos siguientes:

1º- Un equipo triaxial fluxgate modelo FGE suspendido que constituye el principal del Observatorio, junto con un magnetómetro escalar de efecto Overhauser GSM90.

2º- Un Magnetómetro GEOMAG M390, como equipo de apoyo al principal, formado por un magnetómetro vector triaxial fluxgate y un magnetómetro escalar de efecto Overhauser GSM90.

Un software específico permite la integración indistinta de los equipos completos FGE y GEOMAG en la red Intermagnet.

El conjunto de las aplicaciones realiza las funciones necesarias para tener un control de los distintos parámetros que intervienen en los registros digitales del FGE, así como un conocimiento puntual de las variaciones e inter comparaciones de cada una de las componentes del campo magnético en ambos equipos.

Las funciones principales que efectúan se resumen en las siguientes:

- a) Adquisición y almacenamiento de datos del FGE cada segundo. Conversor A/D de 16 bits de 8 canales. Valores cada minuto del magnetómetro GSM90. Cálculo con filtro Gausiano de 19 puntos y creación de fichero formato Intermagnet a partir de las lecturas cada 5 segundos.
- b) Control de reloj a través de GPS.
- c) Adquisición de datos del equipo Geomag vía RS232.
- d) Selección y gestión del archivo.
- e) Envío automático de archivos por correo electrónico.
- f) Presentación numérica y representación gráfica de los datos registrados en tiempo real.
- g) Explotación y tratamiento de archivos diarios almacenados en la base de datos

3º- Un equipo de magnetómetros vectores constituido por dos bobinas Catalán, situadas en posición horizontal sobre basadas giratorias, y magnetómetros de precesión Geometrics modelos G856AX. El intervalo de muestreo es de 8 segundos. Los valores de minuto son el promedio de las lecturas centradas alrededor del minuto exacto. El control de los distintos parámetros y la adquisición de datos se realiza por unidades Datamag con una capacidad de almacenamiento de 8 días.

La salida analógica de las tres componentes H, D y Z del fluxgate FGE, se registra en papel continuo a 20 mm/h, utilizándose para la elaboración mensual del boletín de variaciones rápidas.

4º. PROCESO DE DATOS

Para detectar errores en los valores de minuto y estudiar la estabilidad de los equipos, se obtienen las diferencias entre los valores de la fuerza total F, medida por los magnetómetros Overhauser y el valor deducido de $(H^2+Z^2+E^2)^{(1/2)}$. Los datos erróneos son sustituidos por los correctos, después de realizar comparaciones entre las componentes H, D y Z de los distintos equipos.

Tanto las bases diarias, como los archivos de valores de minuto ya corregidos, se envían mensualmente a nuestros servicios centrales en Madrid, donde se procesan los datos en PCs, mediante los programas desarrollados para tal fin.

Los índices K se obtienen por el método FMI. El valor para K=9 es de 350 nT.

Desde 1997 los valores digitales de minuto, los valores medios horarios y los índices K son enviados a INTERMAGNET para ser publicados en el CD-ROM anual.

Mensualmente se confecciona el boletín de actividades Magnéticas.

OBSERVATORIO GEOMAGNÉTICO DE GÜIMAR - TENERIFE

GUI

OBSERVATORIO GEOFÍSICO DE GÜÍMAR - TENERIFE (GUI)

1. INTRODUCCIÓN

Este anuario recoge los resultados de las observaciones magnéticas llevadas a cabo durante el año 2004 en el observatorio Geofísico de Güímar - Tenerife, situado a 27 Kms. al Sur de Santa Cruz de Tenerife y a 4 Kms. de la ciudad de Güímar.

El Observatorio fue inaugurado en el mes de febrero de 1993 y sustituye al observatorio de "Las Mesas" (1961 - 1992). En el anuario geomagnético de 1993 se reflejan las causas que motivaron la clausura del antiguo observatorio, así como se reseñan las características del nuevo.

Todos los valores de este anuario están referidos al pilar fundamental de observaciones, cuyas coordenadas son las siguientes:

| PILAR FUNDAMENTAL | | | | | GUI |
|-------------------------|-------------|---------|---------------------------|----------|-----|
| COORDENADAS GEOGRAFICAS | | | COORDENADAS GEOMAGNÉTICAS | | |
| LATITUD | LONGITUD | ALTURA | LATITUD | LONGITUD | |
| 28°19'15" N | 16°26'26" W | 868.2 m | 34.1° N | 60.5° E | |

Las coordenadas geomagnéticas están referidas al Polo Magnético IGRF 1995 (79.3° N; 71.4° W)

2. MEDIDAS ABSOLUTAS Y BASES

Para la determinación del valor absoluto del campo magnético, el observatorio geofísico de Güímar utiliza como equipo standard un magnetómetro de núcleo saturado (fluxgate) MAG-01 H inclinómetro/declinómetro con sensor MAG A Bartington, montado sobre teodolito amagnético ZEISS THEO 010B. La resolución del fluxgate es de 0.1 nT. con una deriva <0.01 nT/°C.

El procedimiento de observación está basado en la determinación de campo nulo para la obtención de las componentes D. e I. Para eliminar los errores de paralaje entre la sonda y el eje óptico del teodolito, se realizan observaciones en las cuatro posiciones posibles para cada componente, anulando el campo en los minutos exactos y promediando. Para orientación, hay instaladas referencias interiores y exteriores cuyas características se reflejan en el anuario de 1993.

La determinación de las BASES se realizan regularmente dos veces por semana, constando cada sesión de absolutas de tres observaciones completas de D. e I. Las "bases diarias" se obtienen por interpolación lineal entre las bases semanales adoptadas. Desde el año 2002, las observaciones (así como el control de los equipos magnéticos) son realizadas por el técnico superior de sistemas de telecomunicación e informáticos Benito Casas Delgado, contabilizándose un total en este año de 237.

Para referir todos los valores al "Pilar Fundamental", se determinan con un magnetómetro G856AX, durante 15 minutos antes y después de la sesión (con intervalos de muestreo de minuto), los valores de la componente total F., fijando así los distintos gradientes de F entre el "Pilar Fundamental", los distintos magnetómetros (GSM- 90, GSM19) y componente cuadrática del equipo DMI-FGE. En el siguiente cuadro se reflejan las diferencias observadas entre el PF y las "F" del equipo principal.

| 27/05/04 | 11:45 | -189.0 | 56.1 | MEDIAS | | -189.5 | 56.1 |

Mediante programa CABSWIN, desarrollado en este observatorio, se han determinado las bases para D., H. y Z., de los distintos equipos. Las bases adoptadas son las suavizadas por la media entre las calculadas del día de observación, día anterior y posterior.

3. VARIÓMETROS

Para el registro digital de las componentes magnéticas, este observatorio dispone de los siguientes equipos:

DANI-GSM19

Instalado en la sala N.W. del Pabellón de Variómetros, entra en funcionamiento el mes de noviembre de 1995 y está constituido por:

- Magnetómetro Fluxgate de tres ejes-Modelo F.G.E., sobre plataforma nivelante, construido por El Danish Meterological Institute DMI, que proporciona las variaciones relativas de las componentes H., D. y Z. por diferencias de potencial: un voltio igual a 100 nT.

Las características del equipo se reflejan en el anuario de 1995.

- Magnetómetro de protones GSM19, con resolución de +/- 0.1 nT.

DMI-FGE

Instalado en la sala N.E. del Pabellón de Variómetros, entra en funcionamiento en el mes de Diciembre de 2001 y está constituido por :

- Magnetómetro Fluxgate de tres ejes modelo F.G.E. (versión G), cuyo núcleo de sensores están suspendidos para una mayor estabilidad.

Las características del equipo se reflejan en el anuario de 2002.

El sistema de adquisición de datos es realizado por la unidad DATAMAG, con capacidad de almacenamiento de 8 días, trasvasándose semanalmente a P.C.. Los ficheros que se generan son diarios y en binario por lo que una vez transformados a formato ASCII son corregidos de errores ocasionados por perturbaciones externas o fallos de transmisión.

Conectado a este equipo se utiliza un registrador KONTRON, modelo DCR540, para el registro continuo de las tres componentes H., D. y Z., este registro analógico, con velocidad de 20 mm/h se utiliza para la elaboración mensual del boletín de variaciones rápidas.

DMI-GSM90

Instalado en la sala S.E. del Pabellón de Variómetros, entra en funcionamiento en el mes de Diciembre de 2002 y está constituido por :

- Magnetómetro Fluxgate de tres ejes modelo F.G.E., también suspendido. Las características del equipo se reflejan en el anuario de 2002.
- Magnetómetro escalar de efecto Overhauser GSM90, con resolución de +/- 0.01 nT.

Desde el mes de febrero del 2003, un software específico permite la integración indistinta de los equipos completos : DMI-GSM90 (principal del Observatorio) y DANI-GSM19 (apoyo al principal) para el envío de ficheros diarios a la red INTERMAGNET

Al no tener resuelto de una forma definitiva los sistemas de alimentación y transmisión, se han perdido un total de 8.794 minutos (06 días 02 horas y 34 minutos), equivalente a un 1.67% de la información total anual.

4. PROCESO DE DATOS

Una vez corregidos los archivos diarios de los equipos, así como sus bases, se remiten mensualmente al Servicio de Geomagnetismo en Madrid, donde son procesados los datos en PCs, mediante los programas desarrollados para tal fin.

Los índices se obtienen por el método F.M.I. El valor para K=9 es de 300 nT.

Desde 1997 los valores digitales a intervalos de minuto, los valores medios horarios y los índices K son enviados al “nodo” de París para participar en el proyecto INTERMAGNET, y posteriormente ser publicados en el CD-ROM anual.

Mensualmente se confecciona el boletín de actividades magnéticas (bahías, si, SSC, sfe).
